

Custom Template Filters

Template Filters

- With the use of filters, we can change the text, do arithmetic operations, know the file size, get the date etc.
- You can create your own template filters known as custom template filters

Define own custom filters

- Create templatetags in app directory

```
projectFolder
├── manage.py
├── projectFolder
│   └── app
│       ├── *.py
│       ├── views.py
│       ├── templatetags
│       │   ├── __init__.py
│       │   └── app_tags.py
```

- In the app_tags.py, you can create filters too.
- In app_tags.py

```
from django import template
import datetime
register=template.Library()

@register.filter
def quotes(value):
    s=''+str(value)+''
    return s
```

-
- In template html file

```
{%load app_tags %}
```

- ```
<p>{{que | quotes}}</p>
```
