First Project

How to use Django?

- Django is a framework to develop a website which may contain multiple applications.

- You need to create a project first, in order to build your website.

- Do not get confused with the terms website and web applications. In this course we use term website for our project and web application for the part of independent module of our website. For example, You are building a website for your college e-magazine then articles, forum, quiz, news are different applications in the website. Each of which is independent and complete in itself. The best part is, you can use any application in other project without pain.

- We are going to develop our first project to gain the knowledge on how to begin with django.

How to create Django Project?

- Create a workspace folder. Just create a new folder anywhere in your computer hard drive where you want to store all your projects. For example in F:/projects

- Now open cmd or windows shell and type the following command

  django-admin startproject firstproject

- The last word of the above command is the name of your project. You can choose any name but django or test.

- Now open IDE (Atom or PyCharm). [Do as shown in the video]
